

Exome sequencing data of 2500 individuals from different and unrelated domain were analyzed , Biologist found that all were suffering from chronic inflammatory disease

“UBA1 GENE ” MUTATION DETECTED:

Grouped the patients buy unusual DNA mutation -UBA1 gene

All were suffering from Chronic disease while having this specific mutation in their genes

SINGLE-CELL-MULTI-OMIC” MAPPING:

Computational biologist use this cell mapping to figure out how this mutation really effects and where it affects

Computationally transcript gene models pointed that UBA1 triggers WBC to self destruct and leak inflammatory signal in body

Team :

National institute of health usa

- Dr.David B.Beck , Dr Peter Grayson , Dr.Daniel L.Kastner, Daron Ross

BONE MARROW TRANSPLT:

Allogenic hematopoietic stem cell transplant(bone marrow transplant) is found to be a definitive cure to these chronic Inflammatory diseases

Present case scenario:

Dana faber cancer institute is even using these genetic profiles and designing small molecules drugs targeting UBA1 cell living in a healthy body
